Karlsruhe Institute of Technology

```
fac :: Int -> Int
fac 1 = 1
fac n = n * fac (n-1)
```

```
fac :: Int -> Int
fac (I# n) = case n of
  1# -> I# 1#
  _   -> case fac (I# (n -# 1#)) of
    I# m -> I# (n *# m)
```

```
fac :: Int -> Int
fac (I# n) = I# (facw n)
facw n = case n of
  1# -> 1#
  _   -> n *# facw (n -# 1#)
```

Worker/Wrapper Transformation

`f x = <e>`

`f x = case fw x of`
 `(# a, b ... #) -> C a b ...`

`fw x = case <e> of`
 `C a b ... -> (# a, b, ... #)`

Worker/Wrapper Transformation

```
fac (I# n) = case n of
  1# -> I# 1#
  _   -> case fac (I# (n -# 1#)) of
    I# m -> I# (n *# m)
```

Worker/Wrapper Transformation

```
fac n = I# (facw n)
facw (I# n) = case (case n of
  1# -> I# 1#
  _   -> case fac (I# (n -# 1#)) of
    I# m -> I# (n *# m)) of
  I# res -> res
```

Worker/Wrapper Transformation

```
fac n = I# (facw n)
facw (I# n) = case n of
  1# -> case I# 1# of I# res -> res
  _   -> case fac (I# (n -# 1#)) of
    I# m -> case I# (n *# m) of
      I# res -> res
```

Worker/Wrapper Transformation

```
fac n = I# (facw n)
facw (I# n) = case n of
  1# -> 1#
  _   -> case fac (I# (n -# 1#)) of
    I# m -> n *# m
```

Worker/Wrapper Transformation

```
fac n = I# (facw n)
facw (I# n) = case n of
  1# -> 1#
  _   -> n *# facw (I# (n -# 1#))
```

Worker/Wrapper Transformation

```
fac (I# n) = I# (facw n)
facw n = case n of
  1# -> 1#
  _   -> n *# facw (n -# 1#)
```

When is this beneficial?

```
data E = Add E E | Lit Int
eval (Add l r) = eval l + eval r
eval (Lit n) = n
```

When is this beneficial?

```
data E = Add E E | Lit Int
eval e = Int# (evalw e)
evalw (Add l r) = evalw l +# evalw r
evalw (Lit n) = case n of I# n' -> n'
```

When is this beneficial?

```
data E = Add E E | Lit Int
eval e = Int# (evalw e)
evalw (Add l r) = evalw l +# evalw r
evalw (Lit n) = case n of I# n' -> n'

sum $ map (eval . Lit) [1..1000000]
```

Nested CPR – Motivation

```
facIO :: Int -> IO Int
facIO 1 = pure 1
facIO n = do
    m <- facIO (n-1)
    pure (n * m)
```

Nested CPR – Motivation

```
facIO :: Int -> World -> (World, Int)
facIO 1 s = (s, 1)
facIO n s =
    let (s', m) = facIO (n-1) s in
    (s', n * m)
```

Nested CPR – Motivation

```
facIO :: Int -> World -> (World, Int)
facIO (I# n) s = case facIOw n s of
    (# s, n #) -> (s, n)
facIOw :: Int# -> World -> (# World, Int #)
facIOw 1# s = (# s, 1 #)
facIOw n s = case facIOw (n -# 1#) s of
    (# s', m #) -> (# s', I# n * m #)
```

Nested CPR – Motivation

```
facIO :: Int -> World -> (World, Int)
facIO (I# n) s = case facIOw n s of
    (# s, n #) -> (s, n)
facIOw :: Int# -> World -> (# World, Int# #)
facIOw 1# s = (# s, I# 1 #)
facIOw n s = case facIOw (n -# 1#) s of
    (# s', I# m #) -> (# s', I# (n *# m) #)
```

Nested CPR – Motivation

```
facIO :: Int -> World -> (World, Int)
facIO (I# n) s = case facIOww n s of
    (# s, n #) -> (s, I# n)
facIOww :: Int# -> World -> (# World, Int# #)
facIOww 1# s = (# s, 1# #)
facIOww n s = case facIOww (n -# 1#) s of
    (# s', m #) -> (# s', n *# m #)
```

When to apply this?

```
f :: Int -> (Int, Int)
f x = (x-1, x+1)
```

Careful!

- Divergence

When to apply this?

```
f :: Int -> (Int, Int)
```

```
f x = (x-1, x+1)
```

```
f' :: Int -> (Int, Int)
```

```
f' x = case f'w x of
```

```
    (# a, b #) -> (I# a, I# b)
```

```
f'w (I# x) = (# x -# 1#, x +# 1# #)
```

Careful!

- Divergence

When to apply this?

Careful!

- Divergence

```
f :: Int -> (Int, Int)
```

```
f x = (x-1, x+1)
```

```
f' :: Int -> (Int, Int)
```

```
f' x = case f'w x of
```

```
    (# a, b #) -> (I# a, I# b)

```

A different angle

```
data E = Add E E | Lit Int
eval (Add l r) = I# (eval_ub l #+ eval_ub r)
eval (Lit n) = n
eval_ub (Add l r) = eval_ub l #+ eval_ub r
eval_ub (Lit n) = case n of I# n' -> n'
```

```
sum $ map (eval . Lit) [1..1000000]
```

⇒ “Return-pattern specialisation”

Return Pattern Specialisation vs. Nested CPR

```
facIO :: Int -> IO Int
```

```
facIO 1 = pure 1
```

```
facIO n = do
```

```
    m <- facIO (n-1)
```

```
    pure (n * m)
```

```
main = facIO 1000 >=> print
```

Return Pattern Specialisation vs. Nested CPR

```
facIO :: Int -> World -> (World, Int)
facIO 1 s = (s, 1)
facIO n s = case facIO (n-1) s of
  (s', m) -> (s', n * m)
```

```
main s = case facIO 1000 s of
  (s', I# n) -> printw n s'
```

Return Pattern Specialisation vs. Nested CPR

```
facIO :: Int -> World -> (World, Int)
```

```
facIO 1 s = (s, 1)
```

```
facIO n s = case facIO (n-1) s of  
  (s', m) -> (s', n * m)
```

```
facIO_ub :: Int# -> World -> (# World, Int# #)
```

```
facIO_ub 1# s = (# s, 1# #)
```

```
facIO_ub n s = case facIO_ub (n -# 1#) s of  
  (# s', m #) -> (# s', n *# m #)
```

```
main s = case facIO_ub 1000 s of
```

```
  (# s', n #) -> printw n s'
```

Other Possible Topics

- Reliable Constructor Specialisation for functions/lambdas
 - Zero-overhead `concat` in Stream Fusion!
- Pattern-match Checking
- Backend work?
- Frontend work?
